

Bennetts Lane Bridge, Franklin Township Somerset County, New Jersey

GTS Consultants provided topographic survey and right of way mapping for the replacement of the Bennetts Lane Bridge. The survey task included location of all existing surface features, subsurface utilities, delineated wetlands, and stream banks. As part of this project, GTS researched and developed the existing right of way through deeds, prior right of way dedications, and road widening easements.

GTS provided roadway cross-sections for approximately 600 feet and stream cross-sections for a distance of 500 feet upstream and downstream from the existing bridge.

The Bennetts Lane Bridge provides local access to residential and agricultural areas of Franklin Township and has been limited to four tons gross vehicle weight. The project is being administered by Somerset County.

Upon County acceptance of a final bridge and road configuration, GTS will prepare any required permanent roadway easements and temporary construction easements.
